

a|VariMount

When assembling optical set-ups for beam shaping, it can be challenging to align all the elements correctly without increasing the risk of tilting and decentering. The a|VariMount installs directly onto your mounting plate, allowing for perfect integration and alignment of components without additional adapters. It is available in three diameters (30, 50, 56.8 mm) and can be integrated into cage systems (30, 60 mm) and mounted on rail systems. Its design reduces stress peaks and deformations, making it easy to integrate even sensitive frames (e.g. aluminum alloys). The holder features centric threaded connections M4 and M6 for added flexibility to mount on posts.
